- The process or system to be modeled.
- Input variables and their probability distributions.
- The output or metric of interest.

Step 2: Choose Appropriate Probability Distributions

Select distributions that best represent input uncertainties:

- `randn` for normal distribution.
- `exprnd`, `lognrnd`, etc., for specific distributions.

Step 4: Run Simulations and Collect Results

Iteratively generate samples, compute outcomes, and store them for analysis.

Step 5: Analyze and Visualize Results

Use MATLAB's plotting functions to visualize distributions, histograms, and statistical summaries.

Sample MATLAB Monte Carlo Simulation Code

Below is a basic example illustrating how to perform a Monte Carlo simulation in MATLAB to estimate the probability that a system's output exceeds a certain threshold.

```
``matlab

% Number of simulation iterations

numSimulations = 10000;

% Preallocate array for results

results = zeros(numSimulations, 1);

% Define parameters for input distributions

mu = 50; % Mean of input variable

sigma = 10; % Standard deviation of input variable

% Threshold for failure condition

threshold = 70;

for i = 1:numSimulations

% Generate a random sample from a normal distribution

inputSample = mu + sigma randn();

% Define the system model (example: linear function)

output = 2 inputSample + randn(); % adding some noise

% Store whether output exceeds threshold

results(i) = output > threshold;

end

% Calculate probability of failure
```

```
failureProbability = mean(results);

fprintf('Estimated probability that output exceeds %.2f is %.2f%%\n', ...

threshold, failureProbability 100);

...
```

This simple code demonstrates the core concept: sampling input variables, evaluating the system model, and analyzing the probability of a specific event.

``matlab

parpool; % Initiate parallel pool

parfor i = 1:numSamples

sampleInputs(i) = randn(mu, sigma);

sampleOutputs(i) = model(sampleInputs(i));

end

delete(gcp('nocreate')); % Close parallel pool

``
```
