This report presents the design, simulation, and experimental validation of a solar-powered LED street lighting system suitable for urban environments. The system integrates photovoltaic panels,

batteries, charge controllers, and LED luminaires. Key parameters such as energy consumption, system efficiency, and operational autonomy are analyzed. Results demonstrate the viability of sustainable lighting solutions with potential energy savings and environmental benefits.

Introduction

Urban street lighting accounts for a significant portion of municipal energy consumption. Transitioning to renewable energy sources?specifically solar power?can reduce operational costs and carbon footprint. This study outlines the development of a self-sufficient solar LED street lighting system, emphasizing efficiency optimization and cost analysis.

Literature Review

Existing systems leverage various configurations of solar panels and batteries, with recent advances in LED technology enhancing luminous efficacy. Prior research highlights challenges such as battery degradation and system sizing, which this project aims to address through optimized component selection and control algorithms.

Methodology

- Design Specifications: 10W LED luminaires, 100W solar panels, 12V lead-acid batteries.
- Simulation Tools: MATLAB/Simulink for system modeling.
- Prototype Construction: Assembling components on a test platform.
- Data Collection: Monitoring voltage, current, and illumination levels over 30 days.

Results

- Energy Balance: System provided an average of 12 hours of illumination per night.
- Efficiency Metrics: Overall system efficiency recorded at 75%.
- Battery Performance: Capacity retention maintained above 85% after 200 cycles.

Discussion

The system demonstrated reliable operation with sufficient autonomy. The minor discrepancies between simulated and experimental data are attributed to environmental factors and component tolerances. The study suggests that proper sizing and quality components are critical for long-term performance.

Conclusion

The experimental validation confirms the feasibility of solar-powered LED street lighting. Future work could explore advanced battery technologies and smart control systems for enhanced efficiency.
