Start with a real biological question, such as:

- How does the population of a species grow over time?
- What is the rate of nutrient absorption under different conditions?
- How does neural activity change during stimulus exposure?

Step 2: Mathematical Model Development

Translate the biological question into a mathematical model:

- Define variables (e.g., population size $P(t)$)
- Establish relationships (e.g., growth rate depends on current population)

Step 3: Application of Calculus Principles

Use calculus tools to analyze the model:

- Derive differential equations governing the system.
- Calculate derivatives to analyze rates.
- Integrate to find total effects or accumulations.

Step 4: Solution and Interpretation

Solve the equations (analytically or numerically) and interpret results in biological terms:

- Identify equilibrium points (steady states).
- Determine stability and possible oscillations.
- Predict future behavior under different conditions.

Step 5: Validation and Refinement

Compare model predictions with experimental data, refine assumptions, and improve the model's accuracy.

- Analyzing how neural signals propagate over time.

4. Pharmacokinetics and Drug Dosage

- Using integrals to calculate total drug exposure.
- Modeling drug absorption and elimination over time with differential equations.

5. Epidemiology and Disease Spread

- SIR models (Susceptible-Infected-Recovered):

\[

$$\frac{dS}{dt} = -\beta SI, \quad \frac{dI}{dt} = \beta SI - \gamma I$$

\]

- Analyzing thresholds for outbreaks and control strategies.
