- To explore the physical stability of pharmaceutical formulations.
- To study the mechanisms of drug absorption and release.
- To apply physical principles in formulation development and quality control.

Fundamental Concepts in Physical Pharmacy

1. States of Matter and Their Significance

Understanding the physical states?solid, liquid, and gas?is foundational:

- Solids: The most common form of drugs; characterized by fixed shape and volume. Their crystalline or amorphous nature affects solubility and stability.

- Liquids: Used in formulations like syrups and solutions; their flow properties influence drug delivery.
- Gases: Less common in pharmaceuticals but relevant in inhalation therapies.

The physical state influences dissolution rate, bioavailability, and stability.

2. Properties of Matter

Key properties include:

- Melting point: Indicates crystalline purity and stability.
- Solubility: The maximum amount of drug dissolved in a solvent at a given temperature.
- Partition coefficient: The ratio of concentrations of a compound in two immiscible solvents; predicts drug absorption.
- Viscosity: Affects flow and mixing of liquid formulations.
- Surface tension: Influences droplet formation and dispersion.

3. Colligative Properties

Properties that depend on the number of solute particles:

Pharmaceutical Solutions and Dispersions

1. Solubility and Dissolution

Solubility determines the extent to which a drug can dissolve in a solvent, affecting bioavailability. Factors influencing solubility include temperature, pH, and the presence of other solutes.

Dissolution: The process by which a solid substance becomes dispersed in a solvent to form a solution. Governed by Fick's law of diffusion, it impacts the rate at which a drug becomes available for absorption.

Application: Enhancing solubility through salt formation, particle size reduction, or the use of solubilizing agents.

2. Diffusion and Permeability

Diffusion, described by Fick's law, involves the movement of molecules from high to low concentration. Permeability relates to the drug's ability to cross biological membranes, influenced by molecular size, lipophilicity, and membrane integrity.

3. Types of Dispersions
