- Displacement Vector ($\{d\}$) contains unknown displacements and rotations at the DOFs.
- Force Vector ($\{F\}$) contains applied loads and internal forces.
- The primary goal is to relate these vectors via the system matrices.

System Matrices

- Global Stiffness Matrix ($[K]$): Links displacements to applied forces: $[K]\{d\} = \{F\}$.

- Modify the global matrices accordingly (e.g., by eliminating known displacements or applying constraints).

Step 4: Input of Loads

- External loads include point loads, distributed loads, moments, and thermal effects.
- Convert distributed loads to equivalent nodal forces where necessary.

Step 5: Solving the System

- Solve the matrix equation $[K]\{d\} = \{F\}$ for the unknown displacements $\{d\}$.
- Use numerical methods such as Gaussian elimination, LU decomposition, or iterative techniques.

Step 6: Internal Force and Moment Calculation
