Additionally, DNA has thymine, whereas RNA has uracil instead. Describe the process of photosynthesis as outlined in Form 4 Biology Paper 3 questions. Photosynthesis is the process by which green plants convert light energy into chemical energy. It occurs in the chloroplasts, involving the absorption of light by chlorophyll, and results in the formation of glucose

and oxygen from carbon dioxide and water, following the general equation: $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. Explain the role of enzymes in biological reactions according to Form 4 syllabus. Enzymes are biological catalysts that speed up chemical reactions in living organisms by lowering the activation energy. They are specific to substrates and are not consumed in the reactions, facilitating processes like digestion, respiration, and photosynthesis. What is the significance of the cell membrane as discussed in Form 4 Biology Paper 3? The cell membrane controls the movement of substances in and out of the cell, provides protection and support, and maintains the cell's internal environment. It is selectively permeable, allowing only certain molecules to pass through. Describe the process of respiration in humans as covered in Form 4 Biology Paper 3. Human respiration involves the intake of oxygen and release of carbon dioxide. It occurs in the lungs where oxygen diffuses into the blood and carbon dioxide diffuses out. The process includes glycolysis, the Krebs cycle, and oxidative phosphorylation, producing energy in the form of ATP. What are the functions of the circulatory system as outlined in Form 4 Biology Paper 3? The circulatory system transports nutrients, gases (oxygen and carbon dioxide), hormones, and waste products throughout the body. It also helps in temperature regulation and immune responses. Define osmosis and describe its importance in biological systems based on Form 4 syllabus. Osmosis is the movement of water molecules from a region of lower solute concentration to a region of higher solute concentration across a semi-permeable membrane. It is vital for cell turgor, nutrient absorption, and waste removal. What are the differences between monocots and dicots as discussed in Form 4 Biology Paper 3? Monocots have one cotyledon, parallel leaf venation, scattered vascular bundles, and fibrous roots. Dicots have two cotyledons, reticulate leaf venation, vascular bundles arranged in rings, and tap roots. Explain the importance of biodiversity as covered in Form 4 Biology Paper 3 questions. Biodiversity is important for ecosystem stability, genetic variation, and providing resources such as food, medicine, and raw materials. Scenario:

A student conducts an experiment to investigate how temperature affects enzyme activity. The student measures the rate of reaction at various temperatures and records the data in a table.

Question:

Using the data provided, describe the trend observed as temperature increases. Explain why enzyme activity peaks at a certain temperature and declines thereafter. Suggest an experimental modification to improve accuracy.

Expert Analysis:

- Data Interpretation:

The student notices that enzyme activity increases with temperature up to an optimal point, after which it sharply declines. This trend reflects the enzyme's kinetic properties, with increased molecular movement at higher temperatures enhancing activity until denaturation occurs.

- Scientific Explanation:

Enzymes have an optimal temperature where their shape and active site are best suited for catalysis. Beyond this point, structural damage reduces activity.

- Possible Experimental Improvements:
- Use a water bath with precise temperature control.
- Repeat measurements to account for variability.
- Use larger sample sizes for statistical reliability.

This kind of question exemplifies the depth of understanding needed for Paper 3 and emphasizes the importance of integrating data interpretation with biological concepts.
