Sample Questions and Answers

Q1: What is the significance of seismology in understanding Earth's interior?

A: Seismology involves studying seismic waves generated by earthquakes. These waves travel through Earth's layers and are recorded by seismographs. Variations in wave speed and behavior help scientists infer the composition, state, and boundaries of Earth's interior layers, such as identifying the mantle-core boundary.

Q2: Describe the process of plate movement at divergent boundaries.

A: At divergent boundaries, tectonic plates move away from each other. Magma rises from beneath Earth's crust to fill the gap, creating new crust and often forming features like mid-ocean ridges and rift valleys. This process is responsible for seafloor spreading.

Sample Questions and Detailed Answers for UPCO 8th Grade Science

1. What is Newton's First Law of Motion? Explain with an example.

Newton's First Law of Motion states that an object at rest will remain at rest, and an object in motion will continue in motion with a constant velocity unless acted upon by an external force. This is also known as the law of inertia.

Example: If a ball is rolling on a smooth, flat surface, it will keep rolling indefinitely unless friction or an obstacle stops it. Similarly, a book lying on a table will stay at rest until someone pushes it.

2. Define the term 'photosynthesis' and explain its importance.

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose. This process primarily takes place in the chloroplasts of plant cells, using sunlight, carbon dioxide, and water.

Importance of Photosynthesis: It is vital because it produces oxygen necessary for respiration in most living organisms and forms the base of the food chain by providing food directly or indirectly to all living beings.

3. Describe the structure and functions of the human heart.

The human heart is a muscular organ roughly the size of a fist, located slightly left of the center of the chest. It has four chambers: two atria (upper chambers) and two ventricles (lower chambers).

- **Function:** The heart pumps blood throughout the body, supplying oxygen and nutrients while removing waste products.

- **How it works:** The right side receives deoxygenated blood from the body and pumps it to the lungs for oxygenation. The left side receives oxygenated blood from the lungs and pumps it to the rest of the body.

4. What are acids and bases? Give examples of each.

Acids are substances that taste sour, turn blue litmus paper red, and react with metals to produce hydrogen gas. Bases are substances that taste bitter, feel slippery, turn red litmus paper blue, and

react with acids to form salts and water.

- **Examples of acids:** Hydrochloric acid (HCl), citric acid, vinegar (acetic acid).
