- Advanced Security: Data encryption, data masking, and improved auditing.
- Automation and Management: Better automation tools and management interfaces, reducing administrative overhead.

What is PL/SQL?

PL/SQL is Oracle's procedural extension to SQL, combining the power of SQL with procedural constructs like loops, conditions, and exception handling. It enables developers to write complex scripts, stored procedures, functions, triggers, and packages that execute efficiently within the Oracle database.

Benefits of PL/SQL include:

- Performance: Executing code on the server reduces network traffic.
- Modularity: Code can be encapsulated within procedures and functions.
- Reusability: Packages promote code reuse.
- Security: Access control and data integrity are enforced through stored procedures and triggers.

Core Concepts of PL/SQL Programming in Oracle 12c

PL/SQL Blocks

A PL/SQL program is structured as blocks:

```
```sql
```

```
DECLARE
```

```
-- Variable declarations
```

```
BEGIN
```

```
-- Executable statements
```

```
EXCEPTION
```

```
-- Exception handling
```

```
END;
```

```
```
```

- Declarative Section: Declares variables, constants, cursors, etc.
- Executable Section: Contains the statements to execute.
- Exception Section: Handles runtime errors gracefully.

Variables and Data Types

Oracle 12c supports various data types, including:

- Scalar types (NUMBER, VARCHAR2, DATE, etc.)
- Composite types (records, collections)

- Reference types (REF cursors)

Proper declaration of variables is crucial for efficient processing.

Control Structures

PL/SQL provides control structures like:

- IF-THEN-ELSE
- CASE
- LOOP, WHILE, FOR loops
- GOTO statements (use sparingly)

These structures facilitate complex logic implementation.

Cursors

Cursors enable row-by-row processing of SQL query results:

- Implicit cursors: Automatically created during SQL statements.
- Explicit cursors: Defined explicitly for complex processing.

Exception Handling

Robust error handling enhances application stability:

```
```sql
```

```
EXCEPTION
```

```
WHEN NO_DATA_FOUND THEN
```

```
-- Handle no data scenario
```

```
WHEN OTHERS THEN
```

```
-- Handle other exceptions
```

```
```
```

Advanced Features of Oracle 12c PL/SQL

Pipelined Table Functions

Pipelined functions allow returning rows as they are produced, improving performance for large data processing:

```
```sql
```

```
CREATE OR REPLACE FUNCTION my_pipeline RETURN SYS.ODCIVARCHAR2LIST PIPELINED
AS
```

```
BEGIN
```

```
-- Function logic
```

```
PIPE ROW ('Sample data');
```

```
END;
```

```
```
```

Autonomous Transactions

Enable executing transactions independently of the calling transaction, useful for logging or auditing:

```
```sql
```

```
PRAGMA AUTONOMOUS_TRANSACTION;
```

```
```
```

Secure Application Development

Oracle 12c introduces features like:

- Data redaction
- Transparent Data Encryption (TDE)
- Fine-grained auditing

These enhance the security of PL/SQL applications.

Developing PL/SQL Programs in Oracle 12c

Creating Stored Procedures and Functions

Stored procedures perform actions, while functions return values:

```
``sql
```

```
CREATE OR REPLACE PROCEDURE update_salary(p_employee_id NUMBER, p_increment  
NUMBER) AS
```

```
BEGIN
```

```
UPDATE employees SET salary = salary + p_increment WHERE employee_id = p_employee_id;
```

```
COMMIT;
```

```
END;
```

```
---
```

```
``sql
```

```
CREATE OR REPLACE FUNCTION get_employee_name(p_employee_id NUMBER) RETURN  
VARCHAR2 AS
```

```
v_name VARCHAR2(100);
```

```
BEGIN
```

```
SELECT name INTO v_name FROM employees WHERE employee_id = p_employee_id;
```

```
RETURN v_name;
```

```
END;
```

```
---
```

Using Packages

Packages group related procedures, functions, variables, and cursors:

```
```sql
```

```
CREATE OR REPLACE PACKAGE employee_pkg AS
```

```
PROCEDURE raise_salary(p_employee_id NUMBER, p_percent NUMBER);
```

```
FUNCTION get_employee_department(p_employee_id NUMBER) RETURN VARCHAR2;
```

```
END employee_pkg;
```

```
```
```

```
```sql
```

```
CREATE OR REPLACE PACKAGE BODY employee_pkg AS
```

```
PROCEDURE raise_salary(p_employee_id NUMBER, p_percent NUMBER) AS
```

```
BEGIN
```

```
UPDATE employees
```

```
SET salary = salary + (salary p_percent / 100)
```

```
WHERE employee_id = p_employee_id;
```

```
END;
```

```
FUNCTION get_employee_department(p_employee_id NUMBER) RETURN VARCHAR2 AS
```

```
v_department VARCHAR2(50);
```

```
BEGIN
```

```
SELECT department INTO v_department FROM employees WHERE employee_id =
p_employee_id;
```

```
RETURN v_department;
```

```
END;
```

```
END employee_pkg;
```

```

```

## Triggers

Triggers automate actions based on database events:

```
```sql
```

```
CREATE OR REPLACE TRIGGER trg_before_insert
```

```
BEFORE INSERT ON employees
```

```
FOR EACH ROW
```

```
BEGIN
```

```
-- Automatically set creation date
```

```
:NEW.creation_date := SYSDATE;
```

```
END;
```

```
---
```

How does data integrity testing differ from data validation testing in database testing? Data integrity testing focuses on ensuring that the data remains accurate and consistent across the database, enforcing rules like primary keys and foreign keys, while data validation testing ensures that the data entered or processed meets the required formats, constraints, and business rules. Why is performance testing important in database testing? Performance testing is important because it assesses how well the database performs under load, ensuring it can handle expected data volume and user activity without degradation, which is crucial for maintaining application responsiveness and stability. What are common challenges faced during database testing? Common challenges include maintaining data privacy and security, handling large volumes of data, ensuring test environment consistency, dealing with complex database schemas, and automating tests effectively.
