Sample Questions from June 2013 Paper and Model Solutions

Question 1: A car accelerates uniformly from 0 to 20 m/s over 10 seconds. Calculate the acceleration and the distance traveled during this period.

Solution:

- Acceleration (a):

$$a = \frac{\Delta v}{\Delta t} = \frac{20 \text{ m/s} - 0}{10 \text{ s}} = 2 \text{ m/s}^2$$

- Distance (s):

Using $s = ut + \frac{1}{2}at^2$, with initial velocity $u = 0$:

$$s = 0 + \frac{1}{2} \times 2 \times (10)^2 = 1 \times 100 = 100 \text{ m}$$

Question 2: Explain how a transformer works and why it is efficient in transmitting electrical energy over long distances.

Answer:

A transformer operates on the principle of electromagnetic induction. It consists of two coils, primary and secondary, wrapped around a common iron core. When an alternating current flows through the primary coil, it creates a changing magnetic flux in the core. This changing flux induces an emf in the secondary coil according to Faraday's law. The ratio of the voltages in the coils depends on the ratio of the number of turns:

$$\frac{V_{\text{secondary}}}{V_{\text{primary}}} = \frac{N_{\text{secondary}}}{N_{\text{primary}}}$$

Transformers are highly efficient because they minimize energy losses when properly designed, mainly due to low resistance in the coils and the high permeability of the core material. They enable step-up voltage transmission, reducing current and minimizing resistive losses in power lines over long distances.

Conclusion and Final Tips

The OCR G482 June 2013 physics exam is a well-rounded test of students' understanding of fundamental physics principles, problem-solving abilities, and practical skills. To excel:
