## Common Questions and Answers from the Milady Workbook Chapter 20

### Q1: What are the main differences between semi-permanent and permanent hair color?

A1: Semi-permanent hair color deposits pigment onto the hair shaft without penetrating the cortex, resulting in a temporary change that lasts through several washes. It contains no ammonia or peroxide, making it gentler. Permanent hair color involves chemical reactions that penetrate the cortex, altering the hair's natural pigment and lasting until new hair grows, requiring root touch-ups.

### Q2: Why is patch testing important before chemical treatments?

A2: Patch testing identifies potential allergic reactions or sensitivities to chemicals used in coloring, relaxing, or perming agents. It helps prevent adverse reactions, allergic dermatitis, or burns, ensuring client safety.

### Q3: What are critical sanitation practices in a salon setting?

A3: Key sanitation practices include disinfecting tools after each use, washing hands frequently, using disposable gloves, cleaning workstations regularly, and properly disposing of waste. These reduce the risk of infection and maintain a safe environment.

### Q4: How do you determine the correct curl size when perming?

A4: Curl size depends on the desired tightness of the wave, client's hair length, and hair type. Smaller rods create tighter curls, while larger rods produce looser waves. Consultation with the client about their preferences is essential for selecting the appropriate size.

## Q5: What are the signs of over-processing during a relaxer application?

A5: Over-processing signs include hair becoming extremely weak, brittle, or breaking, and the scalp feeling irritated or burned. Proper timing, adhering to manufacturer instructions, and performing patch tests can prevent over-processing.
