Practical Examples of VBA in Mechanical Engineering

Example 1: Automating Stress Calculation for Multiple Components

Suppose you have a list of component dimensions and load conditions. VBA can automate the calculation of stress values:

```
``vba
```

```
Sub CalculateStress()
```

```
Dim lastRow As Long
```

```
Dim i As Long
```

```
lastRow = Cells(Rows.Count, "A").End(xlUp).Row
```

```
For i = 2 To lastRow
```

```
Dim force As Double
```

```
Dim area As Double
```

```
Dim stress As Double
```

```
force = Cells(i, "B").Value
```

```
area = Cells(i, "C").Value
```

```
stress = force / area
```

```
Cells(i, "D").Value = stress
```

```
Next i
```

```
End Sub
```

```
...
```

This macro reads forces and areas from columns B and C, computes stress, and outputs it to column D.

Example 2: Creating a Custom Material Property Calculator

Design a user form that allows engineers to input material properties and receive calculated values such as thermal expansion or Young's modulus.

Example 3: Automating Data Import from Experimental Devices

Use VBA to connect to data acquisition systems, retrieve test data, and organize it within Excel sheets for analysis.

A pulley system has a mechanical advantage of 4. If a force of 50 pounds is used to lift an object, what is the weight of the object?

Solution:

$$\text{Weight} = \text{Force} \times \text{Mechanical Advantage} = 50 \text{ lbs} \times 4 = 200 \text{ lbs}$$

Question 2:

In a gear train, Gear A has 20 teeth, and Gear B has 40 teeth. If Gear A rotates clockwise at 100 RPM, what is the rotation speed and direction of Gear B?

Solution:

Speed ratio = Number of teeth on Gear B / Number of teeth on Gear A = $40 / 20 = 2$

Gear B will rotate at $100 \text{ RPM} / 2 = 50 \text{ RPM}$, and due to gear engagement, the direction will be opposite (counterclockwise).
